

Project 5 - Bank Loan

Group 3:

Michel Brun – Paul Melin – Zijing Xue

Dataset - Individual Bank Loan

67463 rows × 35 columns

Independent Variable

- Grade & Subgrade
- Inquiries
- Public Record
- Loan Title
- Debit to Income
- Employment Duration

Dependent Variable

- Loan Amount
- Interest Rate
- Open account

Challenges

- ❖ Enormous database: cleaning and decision
- ❖ Understanding: proper nouns in bank industry
- ❖ Make hypothesis and test: if the result reject the hypo => another time
- ❖ Time management
- ❖ Plot with Streamlit: combine the code in spider using container

Process

PLANNING

- Create GitHub
- Review dataset
- Data cleaning
- Clarify tasks
- Kanban planning

PREPARATION

- Understanding of variables
- Data Cleaning
- EDA
- Correlation

VISUALIZATION

- Make hypothesis
- Plot
- Use Streamlit
- Combine plots from 3 of us
- Slides

Highlights & Learnings

- ❖ Deal with Streamlit : Not the same logic of creation then working on Jupyter
- ❖ Online Streamlit : Requirements and local/online path
- ❖ Kanban : Split the tasks and show the progress of the project

Improvements

- ❏ Better understanding of the dataset
- ❏ Deeper dive into the relationship among variables
- ❏ Have plot with more significant correlation
- ❏ Optimize visualisation

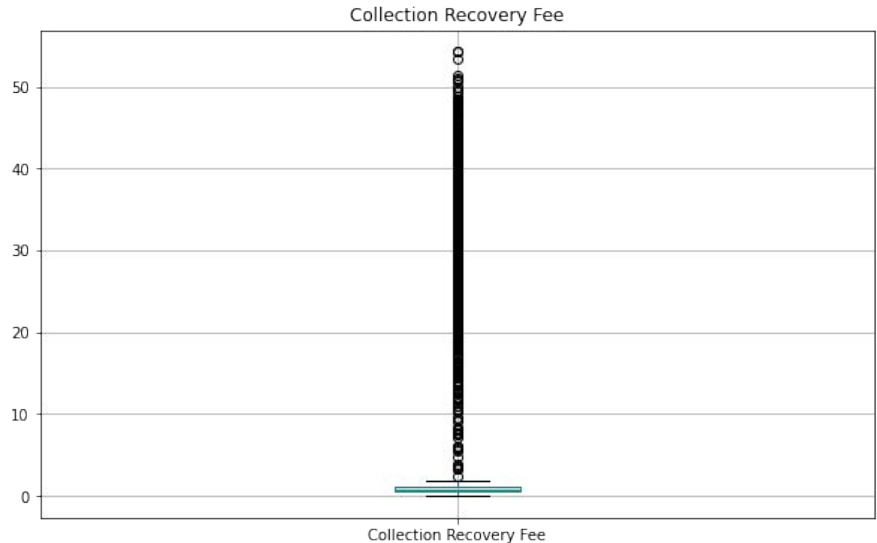

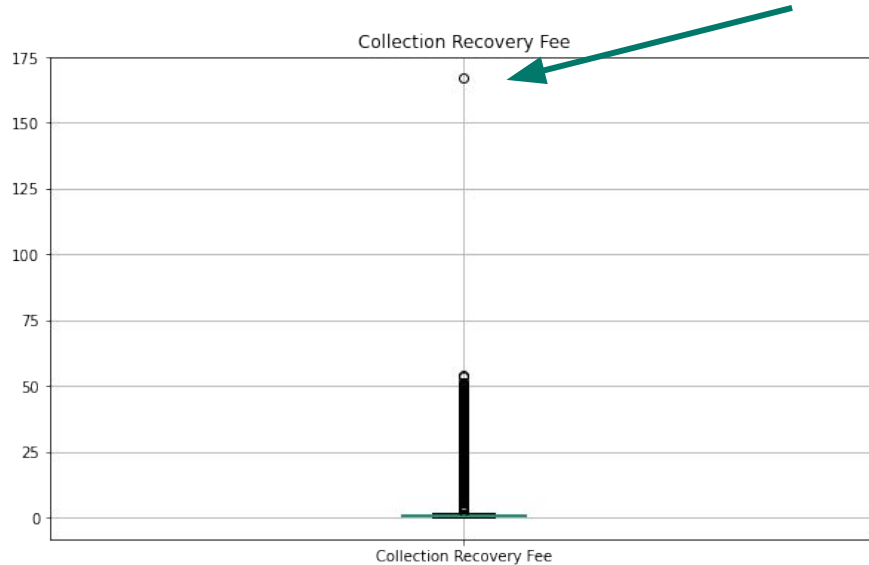

Comparison of the initial and final datasets

- ★ No duplicates - No missing value - Few columns dropped because no exploitable Data
- ★ Loan Title Cleaning => mixed cases, repetitive definition of same type of title, title with few frequency - group into 'other'

Comparison of the initial and final datasets

- ★ Collection Recovery Fee replaced by new Max

Dashboard

[Bank Loan Dashboard on Streamlit online](#)

Thank you :)
